PCR DEVELOPMENT AND STAKEHOLDER CONSULTATION

This product category rule for ‘concrete’ is Version 2.0 of the Product Category Rules (PCR) for ISO 14025:2006 Type III Environmental Product Declarations (EPDs) of Concrete, updating Version 1.1 dated December 2013, published by Carbon Leadership Forum. The following changes have been included in this document:

- Updated background data sets (Appendix A);
- Provides methodology (Section 11.B) for LEED environmental disclosure and optimization compliance;
- Compliance with ISO 21930:2017: and
- Provide option for reporting fewer indicators in the EPD brief (see Sections 5.6 and 9.5).

A committee outlined in Appendix B provided review and input to the revisions. After consideration of existing North American PCRs for concrete materials and products (hosted at ASTM), the new USGBC PCR Guidance Document, European PCRs for concrete and ISO 21930:2017 (see references) the technical committee decided to use ISO 21930:2017 as the ‘core PCR’ and adapt the CLF Concrete PCR to be a ‘sub-category PCR’.

ISO 21930:2017 provides the core rules for construction products and services and must be read in tandem with this document. Technical issues in this sub-category PCR related to concrete production build from the CLF Concrete PCR and align with the ASTM PCR for Precast Concrete (UN CPC 37550) in order to increase standardization of LCA practice in regions that use ASTM standards for concrete.

For information about PCR development and stakeholder consultation, see Appendix B.

No participation fees were charged by NSF to interested parties. NSF International ensured that reasonable balance among the members of the PCR committee were achieved and potential conflicts of interest were resolved prior to commencing this PCR development.
The development of this PCR was supported by:

**The National Ready Mixed Concrete Association**

and

**The Carbon Leadership Forum's sponsors:**
Mithun, the Russell Family Foundation, Stop Waste
Arup, Central Concrete, Interface, Orka Aggregates, Skanska, Thornton Tomasetti
Climate Earth, Magnusson Klemencic Associates, NRMCA
Owens Corning, Simpson Gumpertz & Heger, Thinkstep, Urban Fabric, Walter P Moore

ABOUT NSF’S NATIONAL CENTER FOR SUSTAINABILITY STANDARDS (NCSS)

Through the National Center for Sustainability Standards, NSF develops life-cycle based, multi-attribute sustainability standards, protocols, and PCRs for various industries including building products and materials, furniture, carpet and flooring, fabrics, wallcoverings, roofing membranes, green chemicals, and water and wastewater.

The National Center for Sustainability Standards will continue to add to its growing portfolio while providing education, outreach, and innovative support to private industry, trade associations, government and academia to foster a consensus-based approach toward conformity assessment in the sustainability field. Visit http://www.nsfsustainability.org or contact ncss@nsf.org.

To initiate your LCA, receive your EPD verification, or have questions on where to start, contact NSF Sustainability at sustainability@nsf.org or 734-476-2543.

ABOUT NATIONAL READY MIXED CONCRETE ASSOCIATION (NRMCA)

NRMCA, a non-profit organization based in Silver Spring, MD, represents the producers of ready mixed concrete and the companies that provide materials, equipment and support to the industry. It conducts education, training, promotion, research, engineering, safety, environmental, technological, lobbying and regulatory programs. For more information on NRMCA’s Sustainability Initiatives, visit the following link: www.nrmca.org/sustainability.
1. SCOPE

Per ISO 21930:2017 Section 1 with the following additions:

This sub-product category rule (PCR) addresses UN CPC Group 375–Concrete and enables the development of EPDs associated with the production of that product from cradle-to-gate. This PCR was developed specifically for use where applicants use the following standards: ASTM C94, CSA A23.1/A23.2, UNSPSC code 30111500. An additional PCR is required for concrete products to outline the additional LCA stages such as formwork, reinforcement and curing.

The materials commonly used in concrete are listed in Table 1.

2. **NOMARATIVE REFERENCES**

The following documents are referred to in the text. For undated reference, the latest edition of the referenced document (including any amendments) applies.

ISO 21930:2017 Sustainability in buildings and civil engineering works – Core rules for environmental product declarations of construction products and services.
3. TERMS AND DEFINITIONS

While this PCR will likely be used primarily in North America, it may be used in other regions where program operators deem it appropriate. Per ISO 21930:2017 Section 3 with the following additions:

**concrete**  Concrete is a composite material that consists of a binding medium (cement paste, hydraulic cement and water, and possibly one or more admixtures) embedded with fine aggregate (typically sand) and coarse aggregate (typically gravel) to form a hard solid mass. While the most widely used hydraulic cement is Portland cement, other hydraulic cements include blended cements and cementitious material such as ground granulated blast furnace slag (GGBFS). Pozzolans, both natural and artificial (e.g. fly ash and silica fume) are often used as a cementitious ingredient of concrete.
(Adapted from the definition by Mather and Ozyildirim)

**admixture**: Constituent added during the mixing process in small quantities related to the mass of cement to modify the properties of fresh or hardened concrete.
(per EN 206:2013 + A1:2016)

**aggregate**: Granular material of natural, manufactured, or recycled origin used in construction.

**cement**: Finely ground inorganic material which, when mixed with water, forms a paste that sets and hardens by means of hydration reactions and processes and which after hardening, retains its strength and stability even under water.
(per EN 197-1:2011)
**binder:** Combination of cement and reactive (type II additions).
(per EN 16757:2017)

**EPD brief:** A public report of EPD results that includes less detailed information about the LCA to reflect market demand (e.g., LEED v4) for selected impact categories.

**cubic meter (metre) of concrete:** Quantity of fresh concrete, which occupies a volume of one cubic meter.
(adapted from EN 16757:2017)

**net consumables:** Items used during manufacturing, such as lubricants, grease and oils.

**product specific EPD:** EPD results for a specific product or group of concrete mix designs categorized by performance developed by a manufacturer for a specific ready mix plant location.

**industry average EPD:** EPD results for a specific product or group of concrete mix designs categorized by performance for a specified region.

Note – hazardous waste does not include radioactive waste, see ISO 21930:2017 Section 7.2.14.

**non-hazardous waste:** Commercial / industrial waste that is not hazardous: dust, spoil and other waste from raw materials extraction; waste treated in municipal disposal scheme; and leftover or waste concrete and neutral pH yard scrapings.
4. ABBREVIATED TERMS

Per ISO 21930:2017 Section 4 with the following additions:

5. GENERAL ASPECTS

5.1 Objectives of this PCR

Per ISO 21930:2017 Section 5.1 with the following additions:

The primary objective of this PCR is to provide common rules specific to concrete for the application of ISO 21930:2017 for building and civil engineering works.

Additional objectives include to:

A. describe which stages of a product's life cycle are considered in the EPD and which processes are to be included in the life cycle stages;

B. encourage concrete producers to quantify, report, better understand and reduce the environmental impacts of concrete;

C. promote transparency and incentivize manufacturer specific upstream data;

D. represent concrete appropriately following international standards for building materials and products;

E. specify the data quality and default data to be used in concrete EPDs;
F. support the use and guidance of EPDs in sustainable design construction programs and ratings;

G. address requirements for creating an industry average EPD to enable a pathway towards comparative assessment against company specific EPDs (per LEED v4 MR Credit: Building product disclosure and optimization – Environmental declarations); and

H. enable consistent and comparable reporting of LCA results related to concrete production.

5.2 Life cycle stages

Per ISO 21930:2017 Section 5.2 with the following clarifications:

This PCR enables reporting of a **cradle-to-gate** with options EPD as outlined in ISO 21930:2017 Section 5.2.2.

5.3 Average EPDs for groups of similar products

Per ISO 21930:2017 Section 5.3 with the following clarifications and additions:

A. Examples of Average EPD grouping for concrete products include: performance categories of compressive strength and high early strength; material characteristics of lightweight concrete; and production categories of ready-mix and central-mix.

B. If any environmental indicators for products included in the average differ by more than +/- 10%, the minimum and maximum of the population or dataset shall be reported. Alternately, if a single value is chosen for each impact category for all products, the value reported should be the highest impact within the range of variation, therefore the EPD would report the highest single value for each impact category amongst all of the products or plants included in the average EPD analysis.

C. Manufacturers seeking to benchmark their individual type III EPDs against an industry average EPD shall have participated in the industry average EPD.

D. For full transparency, product specific EPDs are encouraged.
5.4 Use of EPDs for construction products

Per ISO 21930:2017 Section 5.4 with the following clarifications:

This PCR is to create EPDs for use in business-to-business (B2B) communication.

5.5 Comparability of EPDs for construction products

Per ISO 21930:2017 Section 5.5 with the following clarifications and additions:

Comparison based on LCA A1-A3 data, shall be made only if the same secondary data sets, and all subsequent life cycle stages are equivalent for both EPDs.

If Concrete EPDs are used to compare two different concrete mixes, the functional units must be the same. Additionally, the following conditions must be met:

A. the concrete mixes have the same or superior structural, thermal and exposure properties; and

B. for product specific EPD comparisons, results for transportation reflect actual transportation distances.

5.6 Documentation

Per ISO 21930:2017 Section 5.6 with the following additions:

In addition to the EPD and project report as outlined in ISO 21930:2017, the results of the EPD may be reported in an EPD brief. EPD briefs may include less detailed information about the LCA, may aggregate life cycle stages A1-A3, and fewer environmental impact categories and/or inventory indicators. The requirements for an EPD brief are given in Section 9.5.
6. PCR DEVELOPMENT AND USE

Per ISO 21930:2017 Section 6 with the following additions:

This PCR document is effective for five (5) years from the latest date of publication. If after five years, relevant changes in the product category or other relevant factors have occurred (for example, evolution of LCA methodology in ISO 21930:2017), the document will be revised. See Section 5.5 for comparability.

7. PCR FOR LCA

7.1 Methodological Framework

7.1.1 LCA modeling and calculation

Per ISO 21930:2017 Sections 7.1.1, and 7.2.3 – 7.2.6.

7.1.2 Functional Unit

Per ISO 21930:2017 Section 7.1.2 with the following clarifications and additions:

No functional unit is defined in this PCR. However, performance characteristics of concrete shall be reported including:

A. UNSPC Product code and CSI Specification number; and

B. specified compressive strength at specified age in days (e.g., 4,000 psi (28 MPa) at 28 days). Compressive strength can be presented in either SI or US units or both as appropriate for the application.
Additionally, the EPD may include other specified characteristics such as:

- specified environmental exposure class (per ACI 318-14, CSA A23.1 or other specified or accepted standard) (e.g., Exposure Class F1, S0, P0, C1 or F0-F3, S0, P0-P1, C0-C2);
- design slump or slump flow. Example: 4-6 in (10-15 cm); and
- any other specified characteristic that affects concrete performance (e.g. air entrainment, unit weight, high early strength requirements, etc.).

Alternatively, the EPD may provide the minimum specification product descriptions, such as compressive strength (5,000psi 35 MPa); multiple exposure classes; a range of slump or slump flow values; or a range of additional characteristics for EPDs that represent various concrete mixture designs.

7.1.3 Declared unit

Per ISO 21930:2017 Section 7.1.3 with the following clarifications:

Since this PCR only covers Module A (manufacturing), a declared unit shall be used. The declared unit shall be one cubic meter of concrete. Data may additionally be presented per U.S. cubic yard or tonnes (1,000 kg).

7.1.4 Reference service life

Per ISO 21930:2017 Section 7.1.4 with the following clarifications:

As this PCR does not address module B (Use), the reference service life (RSL) of concrete is not addressed.

7.1.5 System boundary with nature

Per ISO 21930:2017 Section 7.1.5.
7.1.6 System boundary between products systems

Per ISO 21930:2017 Section 7.1.6.

7.1.7 System boundaries and technical information for scenarios

Per ISO 21930:2017 Section 7.1.7 with the following additions:

A general system boundary diagram is found in Figure 1.

*Figure 1 – Figure Example System Boundary Diagram*
Items that may be excluded from the system boundary include:

A. production, manufacture, and construction of manufacturing capital goods and infrastructure;

B. production and manufacture of production equipment, delivery vehicles, and laboratory equipment;

C. personnel-related activities (travel, furniture, and office supplies); and

D. energy and water use related to company management and sales activities that may be located either within the factory site or at another location.

7.1.7.1 General

Per ISO 21930:2017 Section 7.1.7.1.

7.1.7.2 A1 to A3, production stage

Per ISO 21930:2017 Section 7.1.7.2 with the following additions:

A. A1 shall include the constituents of concrete listed in Table 1;

B. A2 shall assume all long haul transport by bulk carriers (greater than 322 km (200 mi)) do not typically return empty and thus can use the US LCI dataset which includes 35% additional distance to account for this;

C. A2 shall assume that all short haul transport (local trucks and dump trucks) return empty. Thus, one way transport distance shall be multiplied by (2/1.35) to reflect two way transport and eliminate the 35% additional distance included in the US LCI;

D. A3 shall include transportation activities at the concrete manufacturing site;

E. A3 shall include an assumption of 5% material loss unless product specific data is available and transparently reported in the project LCA report underlying the EPD;
F. A3 shall include ancillary materials which include, but are not limited to, lubricating oils, engine oils, & other consumable operations equipment maintenance (OEM) products;

G. A3 shall include final end of life treatment for any manufacturing waste. For example, admixture and ancillary material packaging. Concrete returned from construction sites is not included in A3; it is included in the construction process stage A5; and

H. For all truck (transit) mixing plant operations covered in the EPD, a default factor of 30% of all mixing truck (fleet) energy use is to be allocated to module A3, regardless of whether A4 is reported. This default is to be applied and quoted in the EPD unless a specific power takeoff analysis has been completed and is transparently documented in the project LCA report underlying the EPD. Per Safe, Accountable, Flexible, Efficient Transportation Equity Act: A Legacy for Users, SAFETEA-LU, Section 11144 – PTO Report, SB/SE Research – Philadelphia, Project ID–PHL0019, July 2007, Appendix E.

7.1.7.3 A4 to A5, construction stage

Per ISO 21930:2017 Section 7.1.7.3 with the following additions:

A. A4 is optional. If provided, a description of the reference scenarios shall be part of the EPD;

B. A4, if included, shall include:

   o backhaul; and
   o the remaining 70% of mixing truck (fleet) energy.

C. A5 is optional, but when placement of concrete is included, it shall include the impacts of concrete ordered but not used and returned. Returned concrete shall be considered a waste product and can be used as a burden free input until the point at which it is recovered and processed for further use, and that impacts from recovery and processing operations shall be included in Modules A1-A3 of the system using the secondary material.

7.1.7.4 Use stage

This section of ISO 21930:2017 does not apply.
7.1.7.5 C1 to C4, end-of-life-stage.

This section of ISO 21930:2017 does not apply.

7.1.7.6 Benefits and loads beyond the system boundary in optional supplementary module D.

This section of ISO 21930:2017 does not apply.

7.1.8 Criteria for the inclusion and exclusion of inputs and outputs

Per ISO 21930:2017 Section 7.1.8.

7.1.9 Selection of data and data quality requirements

Per ISO 21930:2017 Section 7.1.9 with the following modifications and additions:

ISO 21930:2017 (Table 3) shall be supplemented by Table 2 with additional detail on the upstream data to use in developing the EPD.

<table>

</tr>
</tbody>
</table>

7.2 Inventory analysis

Per ISO 21930:2017 Section 7.2 with the following additions and clarifications to sections 7.2.4-6 and additions:

The following materials shall be considered recovered materials and not co-products as is consistent with version 1 of the Concrete PCR and the ASTM PCR for Precast Concrete:

- fly ash;
- blast furnace slag (as a cement); and
- silica fume.
As in the ASTM PCR for Precast Concrete, concrete recycling processes may be treated as closed-loop recycling when the recycled concrete is used as a material input for the production of manufactured concrete and concrete masonry products. In this case only the flows and impacts associated with transportation, recovery and crushing of the recycled concrete shall be taken into account and the need for allocation is avoided since the use of secondary material displaces the use of virgin (primary) materials.

If different allocation options are relevant and a deviation of greater than 20% is a foreseen outcome, a sensitivity analysis shall be initiated. These different allocation approaches and data sets shall be documented and declared in the EPD.

Where potable water from a municipal source is used, the water treatment and distribution systems shall be included as an upstream process, which will have its own resource use and discharges. The impacts of water desalination shall be included.

7.3 Impact assessment indicators describing main environmental impacts derived from LCA

Per ISO 21930:2017 Section 7.3 with the following clarifications:

Of note, ISO 21930:2017 greatly expands the indicators required to be reported. Often the best currently available data such as industry average EPDs for upstream processes do not yet align with ISO 21930:2017.

8. ADDITIONAL ENVIRONMENTAL INFORMATION

Per ISO 21930:2017 Section 8.

Note: ISO 21930:2017 Section 8.4.1 includes requirements for hazardous materials reporting.

9. CONTENT OF AN EPD

9.1 General

Per ISO 21930:2017 Section 9.1.
9.2 Declaration of general information

Per ISO 21930:2017 Section 9.2 with the following clarifications:

A. A simple visual representation of ready mixed concrete is not relevant and thus not required.
B. As the percentage of material components can be considered proprietary information, the list of materials should be reported in order of greatest mass per mix.
C. Include the following table in lieu of ISO 21930:2017, Figure 3:

ISO 21930:2017 Sustainability in Building Construction — Environmental Declaration of Building Products: serves as the core PCR
<Insert Concrete PCR V2 final name> serves as the sub-category PCR
Sub-category PCR review was conducted by:
<Insert name and organization of the panel chair and their contact information>
Independent verification of the declaration and data, according to ISO 21930:2017 and ISO 14025: <insert year of publication>
☐ internal ☐ external
Third party verifier:
<name and contact information of third party verifier>
For additional explanatory material:
<name and email of manufacturer’s representative>
<name and version of EPD software tool (if applicable)>

9.3 Declaration of the methodological framework

Per ISO 21930:2017 Section 9.3 with the following additions and clarifications:
For cradle-to-gate EPDs, scenarios are not required to be reported.
The EPD shall include the following:
A. The note: “The product category rules for this EPD recognize fly ash, silica fume and slag as recovered materials and thus the environmental impacts allocated to these materials are limited to the treatment and transportation required to use as a concrete material input”;

B. A table summarizing the life cycle stages included in the EPD:

<table>

C. A table outlining the primary sources of data used to complete the upstream material LCI background data including the date or version number;

D. For industry average EPDs, include the date and source of industry data survey including a list of all companies who participated in the EPD data; and

E. One of three statements, addressing GWP 100 (years), ODP, EP, AP, and POCP impact categories:

   o ‘This EPD was calculated using industry average cement data. Cement LCA impacts can vary depending upon manufacturing process, efficiency and fuel source by as much as 50% for some environmental impact categories. Cement accounts for as much as <%insert max%> of the impacts of the concrete mixes included in this EPD and thus manufacturer specific cement impacts could result in variation of as much as <%insert max%>.’
Note – Calculation procedure:
If the max percentage of impacts for any impact category for any mix reported in the EPD is 85%, then you multiply 85% by 50% to get a max variation of 42.5% and the statement would read: "Cement accounts for as much as 85% of the impacts of the concrete mixes included in this EPD and thus manufacturer specific cement impacts could result in variation of as much as 42.5%.

- ‘This EPD was calculated using manufacturer specific cement data that represents <insert %> of the total cement used in this mix.’
- ‘This EPD was calculated using manufacturer specific cement data that represents an average of <insert %> of the total cement used in each mix included in this EPD.’

9.4 Declaration of technical information and scenarios

ISO 21930:2017 Section 9.4 does not apply for cradle-to-gate EPDs.

9.5 Declaration of environmental indicators derived from LCA

Per ISO 21930:2017 Section 9.5 with the following additions:
The following additional LCA results shall be included in the EPD:

- abiotic depletion potential for non-fossil mineral resources (ADPelements).

The following clarifications shall be applied and notes added:

A. Many of the impacts and inventory items included in ISO 21930:2017 are emerging and have high levels of uncertainty. This shall be recognized within the EPD with the following note: ‘Emerging LCA impact categories and inventory items are still under development and can have high levels of uncertainty that preclude international acceptance pending further development. Use caution when interpreting data in these categories.’ (Can be listed as shown below or identified by note.)

- Renewable primary energy resources as energy (fuel), (RPRE);
- Renewable primary resources as material, (RPRM);
o Non-renewable primary resources as energy (fuel) \( (\text{NRPR}_E) \);
o Non-renewable primary resources as material \( (\text{NRPR}_M) \);
o Secondary Materials (SM);
o Renewable secondary fuels (RSF);
o Non-renewable secondary fuels (NRSF);
o Recovered energy (RE);
o Abiotic depletion potential for non-fossil mineral resources \( (\text{ADPelements}) \);
o Land use related impacts, for example on biodiversity and/or soil fertility;
o Toxicological aspects;
o Emissions from land use change [GWP 100 (land-use change)];
o Hazardous waste\(^1\) disposed;
o Non-hazardous waste disposed;
o High-level radioactive waste;
o Intermediate and low-level radioactive waste;
o Components for reuse;
o Materials for recycling;
o Materials for energy recovery;
o Recovered energy exported from the product system.

B. When upstream data specified in the PCR and/or used in calculating the EPD do not have data for select impact categories or inventory items, they shall be reported as an ‘x’ or ‘-’ and not zero and qualified with the note: ‘Not all LCA datasets for upstream materials include these impact categories and thus results may be incomplete. Use caution when interpreting data in these categories.’

**EPD Brief**

A EPD brief may be published and report fewer impact categories than the EPD. A EPD brief must include all additional information and statements required in the EPD and provide a link to the EPD.

Add statement to the EPD brief:

A EPD brief may report a single result aggregating life cycle stages A1, A2 and A3 and at a minimum must report the following required impact categories and inventory items:

- Global Warming Potential (GWP 100);
- Ozone Depletion Potential (ODP);
- Eutrophication Potential (EP);
- Acidification Potential (AP);
- Photochemical Smog Creation Potential (POCP);
- abiotic depletion potential for non-fossil mineral resources (ADPelements).
- abiotic depletion potential for fossil resources (ADPfossil);
- total waste disposed (kg);
- Consumption of Freshwater (per ISO 21930:2017, Section 7.2.13).

9.6 Declaration of additional environmental information

Per ISO 21930:2017 Section 9.6 with the following additions:

The following optional additional information may be reported as a separate inventory item:

- carbon sequestered in product (kg). Methodology must be documented and publicly reported.

The following references shall be provided at a minimum in the EPD:

- ISO 21930:2017 Sustainability in Building Construction — Environmental Declaration of Building Products
10. PROJECT REPORT

Per ISO 21930:2017 Section 10.

11. VERIFICATION AND VALIDITY OF AN EPD

Per ISO 21930:2017 Section 11 with the following additions:

A. EPD calculations completed by software systems are permitted provided the software has been verified per similar procedures as verifying an EPD. The process used to verify the software calculations should be publicly accessible and referenced from the EPD.

B. When a product specific EPD is aligned with an industry average EPD the following additional items are required:
   - In order to evaluate the consistency of results between product specific EPDs and industry average EPDs either:
     - The same LCA modeling software and version and background data shall be used to create the EPD, or
     - The LCA modeling software and version shall test representative samples of the regionally specific industry average benchmark data and include in the EPD a report of the maximum percent difference for environmental impact categories: global warming potential, acidification potential, ozone depletion potential and smog creation potential. If a different LCA tool is selected, it shall be used to calculate environmental indicators for a sample of representative mixes taken from the published industry average LCA report. The variation of results produced by the selected LCA modeling software and version, compared to the published environmental indicators in the industry EPD shall be reported as a maximum percent variation for GWP 100, AP, EP or POCP. This is to provide transparency on the variability of results that stem from background data and models.
C. An EPD shall be recalculated when changes to manufacturing practices are reasonably expected to result in a significant change to the EPD results.

D. An EPD shall be recalculated when its period of validity is complete or when updates to the PCR result in significant changes to the EPD results.

E. Significant changes are an increase or decrease of GWP 100, AP, EP or POCP by more than 5% of previously reported result.

APPENDIX A: DEFAULT DATA SOURCES

The default LCA/LCI data noted in Tables A1 of this appendix shall be used unless manufacturer and product specific EPD results are available. Tables A2 and A3 shall be used for all applications unless an alternate standardized regional database is published as a clarification to the Concrete PCR to enable more accurate yet still standardized upstream LCA data. The data noted here shall be used even if more current data is published unless a revised version of Appendix A is issued as a clarification to the PCR.

In order to align with EN 16757 and provide greater clarity on developing methodology, the following characterization factors are defined in Table A4. Per EN 16757:2017 Annex C, “this is a conservative approach coming from the fact that it is difficult to analyze the chemical composition of sand or gravel. As characterization factor of calcium is zero, it uses the assumption that the material consists of silicon only.”

APPENDIX B: TECHNICAL REVIEW COMMITTEE

The following individuals participated in the review committee from Jan 2017 through April 2018.

Manufacturers:

- Bill Larson/Dave McElvain  CalPortland
- Patrick Frawley/Juan Gonzales  Central Concrete/US Concrete
- Jim Blais  Stoneway Concrete/GMC Inc
- Manuela Ojan  (Heidelberg Cement/WBCSD CSI observer)
- Hernan Rodriguez  Cemex

Trade Organizations:

- David Shepherd  Portland Cement Association
- James Bogdan  NRMCA
- Emily Lorenz  Precast/Prestressed Concrete Association

Users:

- Chris Drew  Adrian Smith Gordon Gill (architect)
- David Walsh  Sellen Construction (general contractor)
- Dirk Kestner  Walter P Moore (structural engineer)
- Erin McDade  Architecture 2030 (NGO)
- Jordan Palmeri/Peter Canepa  Oregon Department of Environmental Quality (Gov’t)

LCA Expertise:

- Kate Simonen  CLF/University of Washington (Chair)
- Jamie Meil  Athena Institute
- Laurel McEwen  Climate Earth
- Jessica Slomka  NSF
Decisions by the committee were made by consensus except for the following two issues which were decided by a vote.

**Issue 1: Improving comparability of EPDs**

The committee conducted some research into the comparability of concrete EPDs prepared using different LCA tools and found that while some impact categories were relatively similar (within 10%), other impact categories (most notably ozone depletion potential) varied by as much as 100%. The expected source of the variation is in the assumptions of upstream data and the filling of ‘dummies’ in the US LCI database. The committee recommended increasing the prescription of data in Appendix A.

The majority of the committee (13 votes) voted to require product specific EPDs to report expected variance as noted in Section 9.3 and clarified in Section 11. Two committee members voted to require the industry average EPD to be re-calculated using the same data and tool as the product specific EPD.

**Issue 2: Default datasets**

Industry average EPDs for cement exist for both the U.S. and Canadian markets. Based upon an analysis of the Cement Sustainability Initiative’s (CSI’s) ‘Getting the Numbers Right’ database (GNR - Totals & Averages - Light Report 2015.xls which can be downloaded from CSI), the variation in cement emissions can be significant. One of the goals of the PCR adopted by the committee was to promote transparency and incentivize manufacturer-specific upstream data. The CSI EPD defaults to the 80% ‘worst case’ production efficiency for cement to incentivize the use of manufacturer-specific cement data. In the CLF V1 Concrete PCR cement defaulted to the North America average value for cement. Some committee members wanted to change the default cement value to the 80th percentile unless a manufacturer specific EPD was provided.

The majority of the committee (10 votes) elected to maintain the default as the industry average EPD results for cement and include a note highlighting the variability in cement data and the relative impact of this possible variation as noted in Section 9.3. Five committee members voted for options that increased the cement default data.
THE HOPE OF MANKIND rests in the ability of man to define and seek out the environment which will permit him to live with fellow creatures of the earth, in health, in peace, and in mutual respect.
