Researchers at NSF International recently identified unlabeled DMAA-like stimulants in over-the-counter weight-loss and pre-workout products currently available worldwide.1

Pharmacologic effects similar to DMAA and Ephedrine

Researchers at NSF International recently identified unlabeled DMAA-like stimulants in over-the-counter weight-loss and pre-workout products currently available worldwide.1

Not the first time:
NSF researchers have found potentially harmful compounds in supplements on four occasions.

HIDDEN STIMULANTS: WHAT ARE THE RISKS?

DEPEA – Risk of heart attack.2

DMAA – Elevated blood pressure and cardiovascular problems.3

DMBA – Risk of heart attacks, seizures and neurological conditions.4

Oxilofrine – Nausea and vomiting, tachycardia, chest pain and cardiac arrest.5

Cardiovascular Risks Increase When Products Combined with Caffeine or Exercise

High-Risk Categories of Supplements6

- Weight loss
- Pre-workout
- Muscle building
- Sexual performance

How to Choose Safer Dietary Supplements

Tested to verify product formulation and label claims.

Tested for harmful levels of specific contaminants and fraudulent ingredients.

Produced in manufacturing facilities that are inspected twice a year to comply with U.S. FDA Good Manufacturing Practices (GMP).

NSF-Certified Products Are:

- Tested to verify product formulation and label claims.
- Tested for harmful levels of specific contaminants and fraudulent ingredients.
- Produced in manufacturing facilities that are inspected twice a year to comply with U.S. FDA Good Manufacturing Practices (GMP).
